

What we built, in plain words

A public site that answers one question: can a computer do this job yet? It is live. The scores on it are real runs, but they come from a practice robot, not a famous AI.

CANAIYET.COM

10 JOBS TESTED

PRACTICE SCORES ONLY

NO MODEL BILL

Think of it as a report card for chores. The school is open. The grades are honest. They were not given by the star student yet.

REAL

Built, live, or a score that actually ran.

LABELED PRETEND

True inside a toy office. Not a promise about ChatGPT.

NOT DONE

Do not tell anyone this part is finished.

1 The one-sentence story

We built **Can AI Yet**, a public website that lists everyday business chores and says whether a tested helper can do them. Visitors can search, read a result, and ask for a new test. The house is built and the lights are on at <https://canaiyet.com>.

2 What is real

LIVE

The public site

Home, search, capability pages, method, updates, and a request form. Someone can type “follow up with sales leads” and get a real match.

LIVE

The name on the door

canaiyet.com points at the site. The padlock works. **www** sends people to the main address. Link previews use a branded Can AI Yet card. A yellow note in Vercel only asks for a newer address. The current one still works.

REAL RUN

The 10 report cards

Each score came from a run. Nothing was invented to look good. The site says the evidence is a **simulation**.

SAVED

The filing cabinet

The public results live in a database. Strangers cannot rewrite them. The request form can add a request without opening the private drawer.

3 What the scores really mean

We did **not** pay ChatGPT, Claude, or Gemini to take these tests. A small **practice robot** walked through a fake company called Acme and we graded what it did. Cost so far: **\$0**.

Green means the practice robot passed every case, with only light watching. Yellow means it missed some, so a person should still check the work. No score was copied from a marketing page.

JOB	RESULT	PASSED
Follow up with a sales lead	Yellow	9 of 12, one serious miss
Triage a support email	Yellow	8 of 10, one serious miss
Follow up on an overdue invoice	Yellow	8 of 10
Schedule or reschedule	Green	8 of 8
Update a CRM from email	Green	8 of 8
Reconcile two spreadsheets	Green	8 of 8
Turn meeting notes into actions	Yellow	7 of 8
Write a weekly status report	Yellow	7 of 8
Research a prospect	Green	8 of 8
Change a quoted website line	Green	8 of 8

4 What is pretend, on purpose

- The office is fake. Emails, customers, invoices, and calendars are **practice props**, not your real business.
- The helper is a **reference agent**. It is a stand-in, not a frontier model.
- Search matches words. It does not use the smarter “meaning” search yet.
- Spreadsheet tests use simple tables in memory, not real Excel files.

5 What is not finished

STILL OPEN

A real AI has not taken the test

Until that run happens, do not say “ChatGPT can do this.” Say “our practice robot scored this, in a toy office.”

NEEDS A KEY

The private inbox and nightly jobs

The public site can read. The admin request list and scheduled writes still need the hidden database key. Do not treat the back office as finished.

6 Where to look

- Site: <https://canaiyet.com>
- Backup address: <https://can-ai-yet.vercel.app>
- Code: github.com/heyitschien/can-ai-yet
- Live work list: GitHub Issue [#1](#)

This page is a snapshot for a person to read. If it disagrees with the build spec or Issue #1, those win. You do not need to change the domain tonight.

CAN AI YET · DATED SNAPSHOT, NOT A WORK ORDER · SCORES ARE PRACTICE RUNS
